## Introduction

A nanostructure-transfer technology is under development. Nanostructures of any desired sizes, shapes, and materials can be selectively and additively transferred to another substrate.

## Non-destructive and selective release of nanoparticles

A single nanoparticle is released from a soft substrate by focusing a low-power continuous-wave laser on the nanoparticle. The black dot in the red circle is the gold nanoparticle with a diameter of 200 nm.

## Additive transfer of nanostructures

Nanostructures can be released from a surface in a no-destructive way and then transferred to another surface in a additive way to form the final 2D or 3D nanostructures.
